 quick recap on what an mrad is

✓ Answer ready · 5 hit(s) in 850 ms · LLM 2m 25.7s

● Low-confidence retrieval. The best matching chunk is past the distance threshold (0.55). Treat the answer as a lead, not a citation, and check the source row in the retrieval trace.

Mrad definition: An mrad (milliradian) is a unit of intensity or flux in X-ray spectroscopy and imaging [1].

Constraints for choosing beamlines:

- 2 mrad: IVU
- 4 mrad: IVW
- 7 mrad: Undulator beamline description
- 20-90 keV: High Energy Wiggler (HEW)
- Low Energy Wiggler (LEW): 7-23 keV, Low Energy Wiggler (LEW)

Caveats for choosing beamlines:

- Beam size definition is fixed mask (FM3) and collimator
- Crossed white beam slit and CVD diamond screen used as a viewing screen and filter

Equipment lists:

- Double Multilayer Monochromator (DMM)
- Silicon Channel Cut Monochromator (CCM)
- Kirkpatrick-Baez mirror pair
- In-situ bending mechanism for mirror curvature adjustment
- Spec Motor
- M1 mirror
- M2 mirror
