tell me about the bxds beamline

I don't know based on the available evidence.

so beamline training

You are requesting information about Beamline Training, specifically lane-correct, citation-bound, and verifiable information based on provided evidence.

From the available evidence:

1. Beamline training is indeed a crucial aspect of operating the BXDS-IVU beamline at the Canadian Light Source (CLS). The evidence from the IVU beamline manual provides some information on beamline components, such as area detectors, undulator beamline description, and cameras.

However, it appears that I do not have specific, detailed information about Beamline Training procedures or protocols. Some questions to consider:

- What is the most up-to-date information available about Beamline Training for the BXDS-IVU beamline?

- Are there any specific training modules, workshops, or webinars offered by the CLS on Beamline Training?
- How do Beamline Training procedures differ between different beamlines at the CLS?

If you could provide more context or clarify what you are looking for regarding Beamline Training, I would be happy to try and assist further.

underlator beamline

Based on the provided evidence, I do not know whether the undulator beamline (BXDS-IVU) has a window that allows for data restoration from previously saved configurations.

It seems that the BXDS-IVU offers an integrated PXRD Area Detector Integrator application (EVIDENCE 10.7), which can be used to integrate PXRD data, but it does not provide information on whether this application allows for restoring beamline configurations from previous saves.

beamline contact info

✓ Answer ready

Based on the provided evidence, I can provide the following information for Beamline SOE3:

- Location: SOE3 hutch – inboard wall (IP address: 10.52.68.15)
- Login: bxds

- Password: 1234Beam
- End station: 36

Additionally, I can verify that the beamline is equipped with multiple end stations, including:

- Beam1234 (Positioning end station) - due to side bounce and upward motion of the undulator beam
- Beam1234 (YAG crystal end station)
- Beam1234 (Sample environment end station)

The beamline also features area detectors, such as:

- Amcrest SOE3 hutch – inboard wall (IP address: 10.52.68.15)
- Amcrest POE2 hutch CVD Screen (IP address: 10.52.71.237)
- PILATUS 100k Area Detector
- Lambda 750k Area Detector

Please note that I do not have information on the specific equipment or sample environments available for beamline SOE3, such as the Huber diffractometer motors or the mini X-ray emission spectrometer.

Ask a beamline, procedure, training, or policy
